

CLAIMS

What is claimed is:

- 1. A cord retaining device for non-cord Venetian blinds wherein retaining cords are tied up to the top of snap members by the bottom ends thereof, and the snap members thereof are registered with coupling ball blocks of fixing seats that are mounted on top of double-sided adhesive pieces fastened to both lateral sides of a windowsill so that the retaining cords pulled by children struggling to get free there-from when curiously extend their heads out of the window and get caught thereby will draw upwards the snap members therewith and detach the snap members off from the coupling ball blocks of the fixing seats in the first moment of emergency so as to prevent children from getting cut or strangled by the retaining cords thereof, efficiently protecting the safety of the family.**
- 2. The cord retaining device for non-cord Venetian blinds as claimed in Claim 1 wherein the snap member thereof, made of hard-with-softness plastic, has a support piece with a cord passage disposed thereon protruding at the top thereon, an arc-shaped retaining cavity indented at the interior of the bottom side therein, and an outwardly extended guide arc defining the opening of the retaining cavity at the bottom thereof.**
- 3. The cord retaining device for non-cord Venetian blinds as claimed in Claim 1 wherein the fixing seat, made of hard plastic, is provided with a base at the bottom side thereon.**
- 4. The cord retaining device for non-cord Venetian blind as claimed in Claim 1**

wherein the fixing seat thereof also includes a solid coupling ball block extending at the top surface of the base thereon.

5. The cord retaining device for non-cord Venetian blind, including two sheltering caps, two snap members, two fixing seats, and two double-sided adhesive pieces wherein the sheltering cap has a registration cavity defined at the interior of the bottom side therein and a through hole disposed at the top thereon, and the snap member, made of hard-with-softness plastic, is shaped into form conforming to that of the registration cavity of the sheltering cap, having a support piece with a cord passage disposed thereon protruding at the top thereon, an arc-shaped retaining cavity indented at the interior of the bottom side therein, and an outwardly extended guide arc defining the opening of the retaining cavity thereof; the fixing seat, made of hard plastic, is provided a solid coupling ball block extending at the top surface of a base thereon to be correspondingly matched to the retaining cavity thereof, and the double-sided adhesive piece is shaped like the base of the fixing seat thereof.
